Unit 2 - Computer Systems
Assignment 3 - Installing Hardware and Software

Task 1: Planning and installation and upgrade

	A	B	C	D	E	F	G	H	I	J	K	L	M
1		14/11/16	21/11/16	28/11/16	5/12/16	12/12/16	19/12/16	26/12/16	2/1/17	09/01/17	16/01/17	23/01/17	30/01/17
2													
3	Build a new PC	x											
4	Installation of Windows 8		x										
5	Installing Anti-Virus software			x									
6	Upgrade of Memory			x									
7	Installation of NIC on a new PC			x									
8	Adding PC to the network				x								
9	Upgrade of Anti-Virus software				x								
10	Upgrade of your NIC driver				x								
11	Running Disk CleanUp					x			x			x	
12	Running Defragmentation					x			x			x	
13													
14	Additional notes are required covering the following:												
15													
16	materials;	Hardware (PC case, motherboard, graphics addapter, CPU, PSU, etc.), Tools (Screwdriver, etc.)											
17	timing;	Each task would last a few hours to complete and all the tasks combined would take a few weeks to be fully completed.											
18	communications e.g. with user, manager;	Understand the task and ask for permissions from the manager, staff, etc.											
19	back out procedures;	If something or all goes wrong there is a back out procedure to resolve the problem											
20	gaining permissions and access;	If I were to access the network and to connect a new computer to it I would have to ask the lecturer/tutor or another member of staff.											
21	other e.g. contractual requirements	Are any other staff are outside workers involved with the insatllation											

Task 2: Explanation of Requirements

Materials

To set up a standalone computer system, I will need the materials to build the computer. This can be the parts of the computer itself and the tools needed to build it. For example, the materials of the computer is the: PC case, motherboard, GPU, CPU, PSU, etc. The tools needed depends on what the screws on the PC are, so it could either be a philips screwdriver or a flathead screwdriver, or both. Having the correct materials are important because it gets the task done faster and safer compared to doing the tasks without the correct materials.

Timing

To do each task as quickly and efficiently as possible, everything including the tasks has to be timed so it could be done as soon as possible but also with enough time to complete the tasks fully without needing to rush or miss anything out. For example, each task may take a few hours to complete but they can vary on how much there is that needs to be done. With all tasks combined, it would take a few weeks to get them all to be fully completed.

Communications e.g. with user,manager

To have an understanding of what I am doing on each task or to have permission to do a specific job I would need to have communications with members of staff or the manager so that

I don’t end up making a mistake which could have the potential of damaging equipment or harming myself or the people around me. Having communications are important because it means that the people you are communicating with know what you are doing or that you are asking permission to access a network or PC. Having a lack of communication is a big problem because people, such as the manager, won't know what you are doing or how long you have left, which means that planning would be very difficult.

Back out procedures

If something goes wrong during the tasks there needs to be procedures when something goes wrong so the problem would be resolved or would prevent the problem from creating further damage to hardware or further harm to myself and the people around me. This is important to have because without any backout procedures and something goes wrong, it may take a long time to fix the problem and it could cause a disruption to the timing of other people that are meant to work on the PC.

Gaining permissions and access

To access a network or to connect to a new computer I need to ask permissions from a member of staff or the manager to gain permissions or access due to the health and safety risks and protection of information. This is really important because accessing a network or PC without permission or access could lead to problems which could be very significant to yourself and even others.

Training

Training is required to use specific equipment due to health and safety risks and the potential to damage hardware which could cost money. Not much training is needed to use a computer for basic uses, but using software which is complex or important needs some type of training to it. Building a computer also requires a lot of training on health & safety and to prevent damage to hardware.

Personnel required

The personnel required are the people who are trained and required to carry out all the tasks and to do them without harming themselves or the others around them. This includes the: Manager, staff, students, admin, etc. The reason the different personnel and roles are important in carrying out these tasks is because there needs to be supervision for health & safety of everyone and for permissions and access of certain networks or PCs.
