Unit 20 – Client Side Customisation of Web Pages
Assignment 4 – Website Review

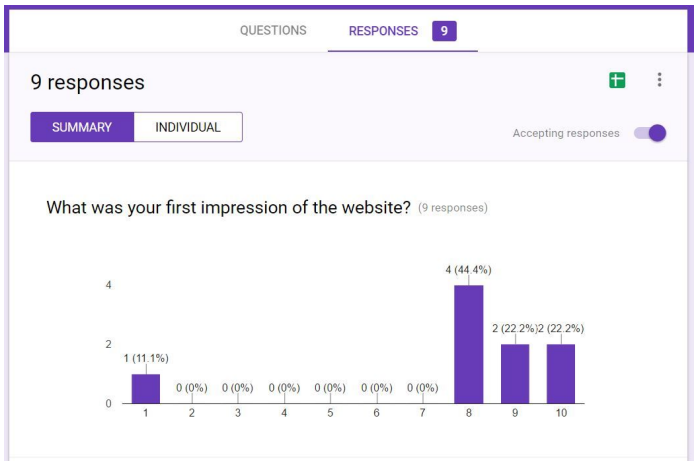

Introduction

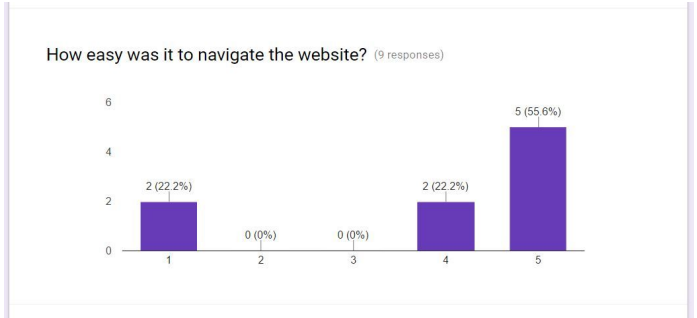

Task description:*As part of your continued employment with InsertName Website you are to demonstrate your website testing and evaluation skills by creating a testing document for your recently created website. Once you have tested your website (and had others test it for you) you are then to evaluate your site and suggest improvements.*

(P6) Test Interactive Pages

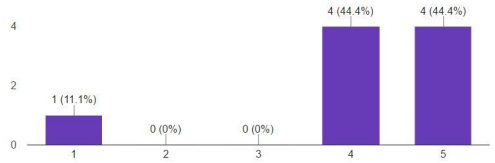

You are to create a testing document that covers the following areas:
- *Links*
- *Functionality*
- *Use of media*
- *Strengths and Weaknesses*
- *Useability*
- *Colour Scheme*
- *Text*

Once you have your testing document you are to test your website as well as have 6 other people test your website for you. You then need to show the results of your testing.

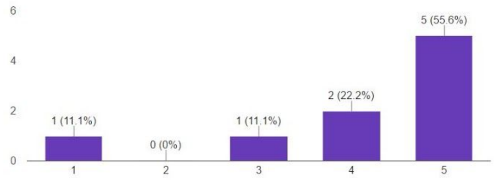

What is your opinion on the layout? (9 responses)

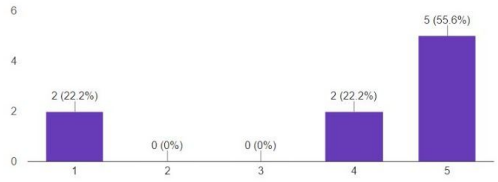

Was the size of the font suitable? (9 responses)

Were the pages very consistent throughout the website? i.e. the navigation bar

(9 responses)

What was it about the visuals of the webpage that made you like/dislike it?

(9 responses)

The layout is great and the colours mix very well
very good but didn't work well then shrinking the page
I like the visuals of the website, I think its pretty good and theirs nothing that you need to change
The visuals of the webpage were good as it was all easy to see and it didn't have any clutter.
I personally felt that it was made quite well, very clean looking if I may say so my self. However when I tried to navigate the website that Leandro Baroca made it was made quite difficult because I could not move the navigation bar around 80.5% of the time. Also the website was not the most colourful that I have seen and could do with some more in it. On the other hand it is good for the visually impaired.
bad
good
I like how tidy and clean the whole webpage was, keeping the layout consistent, I didn't like how there were no images on your site but that wasn't a massive problem.
I like modern looking websites and the colours looked very modern and simplistic which I liked, but it could do with more blue to accent the rest of the site.

How do you think the website could be improved for visually impaired users?
(7 responses)

Maybe an audio feature could be implemented to read what is listed
yeah you could have videos with audio
Maybe having the font slightly bigger or darker as it can be hard to read.
Replace the letters with brail. Thank you.
bad
good
Needs brail.

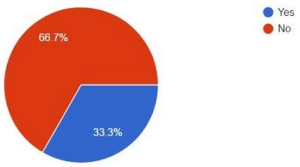

In your opinion, what are the strengths of the website? (9 responses)

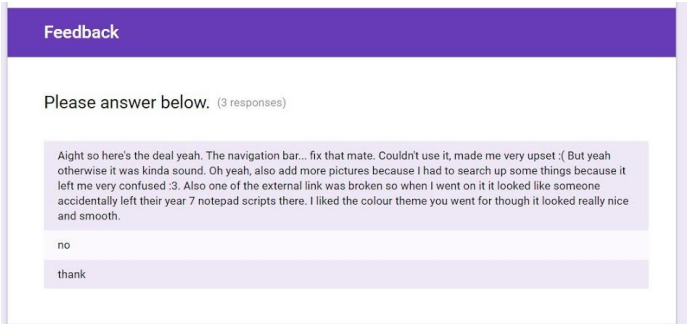

The excellent design
the colour and the layout
I like the layout of the website, i also think the content of the website is very good and i also feel that the website is very consistent
I think that the strengths are that the website is clear and easy to navigate.
I liked the font very much. It was my favourite font. Thank you.
no
yes
How simplistic and neat the website was along with strong information.
The simplicity

In your opinion, what are the weaknesses of the website? (9 responses)

maybe add some more images to give an example of what VR looks like
does not size well
I think there are no weakness to this website
I think that the weakness of the website is the font size and color as it was small and light kind of like the background.
The lack of pictures made it hard to find out what Google Cardboard was. It made me have to search it up myself!!!!!!! However, now I know what Google Cardboard is. It is a wonderful invention where you can put your cellular device into and watch Callums corner but in VR!!!!!!!!! It makes it look like he really is there... I mean wow, quite mind blowing.
yes
good
That there were no images, I'd think that this is quite important to have more people visit your website as you want to attract the younger age groups and images would be eye-catching.
The lack of colours

Do you have any other feedback to give? (9 responses)

Feedback

Please answer below. (3 responses)

Aight so here's the deal yeah. The navigation bar... fix that mate. Couldn't use it, made me very upset :(But yeah otherwise it was kinda sound. Oh yeah, also add more pictures because I had to search up some things because it left me very confused :3. Also one of the external link was broken so when I went on it it looked like someone accidentally left their year 7 notepad scripts there. I liked the colour theme you went for though it looked really nice and smooth.

no

thank

(D2) Evaluate the Web Pages and Discuss improvements

Introduction

For this evaluation, the website which has been created for this unit will be tested and evaluated for functionality and user friendliness. The test will consist of how the colour scheme, layout, font size, usability, good practise, consistency, use of media and content of the website is good for the user experience or needs improvement.

The reason this test and evaluation is being made is so that the website can be improved for the user experience. Since the website has just been recently created and that it had no public interacting and testing of the website, it is possible that it isn't very good for other users. That's why this test and evaluation has been created.

What is the purpose of the website?

The purpose of the created website is to show a basic introduction to the subject of 'Virtual Reality' towards the user. The reason for this is because VR is becoming a much more popular "evolution" of technology and that this topic would interest the user a lot because it is a new piece of technology, which is a trendy topic in this generation.

The website itself would just introduce the user to VR like the user has never heard of this type of technology before. It shows what VR is, what it is used for, what different types of VR there are. It also has 4 different external links to different brands that can sell VR to the public, the reason this was done is so that the user can see where to buy VR technology if the user is interested in purchasing VR.

What is a good one? Why?

With millions websites on the internet, there are some that are extremely good to use and very well made and refined. Especially for websites owned by businesses, because website can be significantly important for a business this day and age, which means that a business focuses on making a website that is good for the user.

For some people, this has made it easier and much more manageable task to create a website individually. However, there are others who find it very difficult to begin, this is why there are still variants of good and bad websites.

Probably one of the most obvious yet most important aspect of making a good website is having an easy navigation system. A surprising amount of websites on the web have a very poorly constructed pages and navigation system, which can leave the user very confused.

The first part of having an easy navigation is to plan and organize the information on the website in a simple and structured way. It is easy to get carried away with the creation of the website and become proud of the creation, but it is important to have a user point of view or to get another person to see any flaws within the website.

Another way of making an easy to navigate website is to check whether the web pages are structured to flow in a logical flow in which it makes sense. This way, when the user visits a website, they will have an easier time navigating to the information of the created website that would be relevant in their own opinion.

Content is also a very obvious but important aspect on creating a website. Since this is the main reason the website has been created, content is the single most important element of making a website good for the user. For this reason, content on a website should be displayed in a simple and clear manner.

Colours can also give an enhancement towards user experience. The reason for this is due to the fact that the colours can make the website easier on the eye for the user and even manipulate the mood of the user. Giving a website a lot of empty white space makes it look very modern because it looks very clean and uncluttered look.

Images can have a much more impactful message for the user than a paragraph, especially when the right (and most relevant) image was chosen for the website. Also, infographics, videos and graphics are also very useful for a website because they can be much more effective at communicating than even the most well written piece of text.

<u>Does the created website contain the features of a good website? Why?</u>

When creating the website, it was important that it had to contain an easy to use navigation system for the website the the user can access all the content that is included on the website. The reason this was done is so the user gets the full experience and the website fulfils its intended purpose.

When creating the website, it was ensured that the biggest priority is to contain relevant content on the website. The content within the website had to be relevant towards the purpose of the website and even the page within the site. This is important so that the user doesn't get confused with the content within the page

The colour scheme of the website was very specific due to the fact that it had to be very simplistic, modern and easy to the eyes of the user. The reason for this is that that website can have a very nice aesthetic and it didn't cause confusion due to the amount of vibrant colours.

For the layout of the website, a modern and slick layout was the planned design for the layout. The reason for this is due to the fact that modern and simplistic websites are very popular today, so the user would expect a modern website to be very professional. This is good because

there's a higher chance that the user will like the look of the website.

For the font size, the created website's font size had to be a reasonable size. What this means is that, the font is a big enough size to read by a lot of people, but not be too big so that it clutters the page or look ridiculous and unprofessional.

The usability of the created website is to be comfortable for the user. The reason for this is so the user doesn't get incontent when using the website. This could range from the buttons not working, the navigation bar not taking the user to the right pages or even the external links not working, linking to a different external page or just linking to a "404 error" page.

The consistency of the website is what makes a website look like a lot of effort has been made into keeping the website looking good in all pages. This means that all the fonts are the same size on all pages, all the buttons are the same size and look the same, etc.

The use of media on the website is important, but wasn't used much in the created website. The reason for this is due to the amount of information that 1 page contained, and an image would increase the amount of content in a page considerably.

How well made is the website according to tests?

The query that has been designed, which is for the feedback of users that have tested the website, is so that the testers give a honest opinion about how good or bad each aspect and content of the website.

With the query itself, there have been 9 different responses. This isn't considered a fantastic amount of responses for a website query, especially if it was a business website. However, this is a good enough number for the first test of the website, so that the biggest and most obvious flaws of the website can be pointed out.

The first question asks "What was your first impression of the website?" and it was a rating between 1 and 10, 1 being the worst and 10 being the best. Almost half the responses (44.4%) have responded with 8/10, which is considered really good and that the user would (initially) like the look of the website. The lowest percentage was 1/10, which was only 11.1% of the responses. The responses that are in the middle (22.2%) are 9/10 and 10/10. This means that the majority of the responses say that the website had a very good initial impression to the user.

The second question asks "How easy was it to navigate the website?", it was another rating question but it was 1 to 5, 1 being the worse and 5 being the best. There were 2 responses that had an equal amount, which was 4/5 and 5/5 with both at 44.4%. This means that 88.8% of the responses say that the layout of the website was extremely good. However, 11.1% responded with 1/5, which was the only other response. Which means people either really like the layout, or dislike it a lot.

The third question asks "Was the size of the font suitable?". Yet again, it was another question with a rating with 1 to 5, with the highest number being the best. The majority of the responses (55.6%) responded with a 5/5, meaning that the font size was very good and didn't need any altering. However, the rest of the 44.4% responded with either 1/5, 3/5 or 4/5. This isn't the

majority of responses, but it is still a lot of responses to consider.

The fourth question asks “Were the pages very consistent throughout the website? i.e. the navigation bar?”. The majority, which is 77.8%, responded with a 5/5 and a 4/5, which is very good and that the website was made very consistently. However, 22.2% responded with a ⅕, which means that there probably was a loading error with the font, the navigation bar or even the external links.

The fifth question asks “What was it about the visuals of the webpage that made you like/dislike it.”, this question was answered with a sentence or a paragraph as a response. All the responses are mostly positive saying that the website is very good and modern looking and that they liked the visuals of the website, especially the colours. However, there was a few points that had to be considered. For example, there were points which said that the website didn't look well when it was zoomed out and one said that the blue colours of the buttons didn't fit well with the rest of the colours.

The sixth question asks “How do you think the website could be improved for visually impaired users?”, this was also a text response. All the questions was responded with improvements that can be added to the website for the visually impaired. For example, one response mentioned that the font could be slightly bigger or darker as it could be hard to read, and another response said that videos with audio can be added to the website.

The seventh and eighth questions will be mentioned in the next part of the evaluation due to its relevance with that section of the evaluation.

The ninth question asks “Do you have any other feedback to give?”, this question is a yes or no question and, if answered with yes, it takes the reviewer to a page where the reviewer can give feedback that isn't related to any of the previous questions asked, with 66.7% of the reviewers responding with no and 33.3% responding with yes, which means that 33.3% wanted to give additional information about the website.

Which takes us the the tenth question, which asks to answer the feedback in the paragraph text box. The responses that I recieved say that the navigation bar was broken when the user was testing out the website, otherwise the rest of the website was good. The lack of pictures has also been mentioned and that more should be added to the website. The external links weren't also working sometimes, which apparently linked to a page with few lines of text that were extremely muddled up. However, the user also said that the colour theme looked really nice and smooth.

Strengths and Weaknesses

The seventh question asks “In your opinion, what are the strengths of the website?”, with yet another paragraph response. The responses that has been received mostly say that the website had an excellent design, that the colours and the layout was good, it was clear and easy to navigate, the font was liked, the simplicity of the website and the “strong” information that was in the website.

This means that most, or even all the users, liked the colours, the layout, the font, the easy

navigation and the simplicity of the website. These strengths are very good for a website because it makes the user feel comfortable because of the modern and clean look of the website which is considered attractive to the users.

This makes a good website because it would make the user want to come back and visit the website.

The eighth question asks “In your opinion, what are the weaknesses of the website?”, with paragraph responses. The responses that have been received say that the weaknesses of the website is that there are hardly any images, that the webpage doesnt size well, the font size because it was too small and colour because it was too light. However, there was one response saying that the website had no weaknesses.

This means that the biggest flaw with the website is that it had very little images and that the reviewers wanted more images to reduce confusion, make it look easier on the eyes and to reduce the effort of reading all the text on the page. As mentioned earlier in the evaluation, images can be more understanding than the best written paragraph.

The other flaws of the website should also be considered, but they aren't as important as the significant flaw that has been spotted out by the majority.

Recommended improvements

Since the positives and the negatives of the website have been reviewed, it is a lot easier to spot out what needs improvements on the site itself. Even though there aren’t many flaws which the testers and reviewers have pointed out, there are flaws which need to be addressed due to the significance and impact the flaw has on the website.

The biggest flaw, lack of images, needs to be addressed with images that have to do with the subject of the website, which is virtual reality. To improve on this, images of a VR headset need to be placed on the website, the reason for this is due to one of the reviewers getting really confused with the explanation of the VR headsets, which the reviewer had to google the images himself to find what the VR headset actually looks like.

Another flaw that seemed to pop up to only some of the people is the website sometimes malfunctioning and not being consistent or linking to external websites properly. This is a very hard flaw to fix due to the fact that it only happened sometimes and not all the time. To address this flaw, a test through the actual code itself has to be carried out so a mistake on the code can be pointed out and debugged. However, if this flaw isn't addressed through the code, it is highly unlikely that it cannot be addressed at all and it's an irreparable bug.

There are other, smaller improvements to the website to be made. Such as adding videos or maybe changing the colour scheme a little bit. However, these improvements will mean that the website needs to be tested again for functionality and whether the new improvement to the website was a good improvement or it made the website worse than the original.

Conclusion

In conclusion, most of the reviewers really liked the website and its layout and they liked how modern it looked and how functional and consistent it is. However, there were flaws that were significant and personally opinionated that have been spotted out, but with the improvements to the website included, it will hopefully will become a much better website for the users to access and learn about the content within it.

All the important parts of the website, such as the colour scheme, layout, font size, usability, consistency, use of media and content were very well done according to the reviews. Which made the overall reviews a lot better than was to be expected from the reviewers. Overall, this means that the website was really well made for its first ever test by other reviewers which does not include the creator of the website itself.
