Development in ICT and Computing

Leandro Baroca

Explain how hardware and security developments could impact Managed Information Systems (MIS)

The newer hardware has an impact to the MIS due to the added sophistication of the newer hardware. What is meant by this is that the newer hardware is much more complicated than the hardware previously made. This would make the hardware easier to use because it can handle lot more, which means more stuff can be added to make it a lot simpler to use.

Security developments are also being improved, this means that the MIS could be evaluated a lot more easier by the manager. This gives him the ability to track the daily activities of the employees, track progress and even make important decisions for the business.

Explain the financial implications of upgrading a large office with new Operating Systems and integrated software.

To upgrade a large office within a business with new operating systems and software would be a bit costly for the business. The reason for this is that the new operating systems is much more sophisticated than the previous ones. This means that they are easier to use, but a lot more complicated on the structure for the OS and software.

That means that the price in the OS and the software would cost a lot more than the previous ones, because they are of better quality. For example, the Windows 10 Pro is priced at roughly £130 for 1 license. If you multiply that to a large office, it would cost the business roughly a few thousand pounds.

Explain the impact on employees, that providing tablet PCs and remote working could have.

With tablet PCs, the employees will definitely have a much more flexible workspace, due to the fact that the tablet PCs are portable. This could be an advantage because they can use the tablet PC to go anywhere they want to work, instead of being in a small office. This could also prove to be its disadvantage, because employees might get distracted with the flexibility of the tablet PC.

Remote working can be proven to be very advantageous. For example: Cloud storage. With the ability to store work online in the cloud means that the employee can access the work with any supported device, which would increase the amount of work. The biggest downside to this, however, is that internet access is needed to access the work via cloud storage.

Explain the impacts on Customer Service that high speed networks and WIFI could have.

With higher speed networks and wifi, the customer service would be much faster and reliable to use. With higher internet speeds, it is more likely a page wouldn’t crash due to the long loading time and it's guaranteed that it would load much faster than before.

The reason this is important to customer service is because most businesses use social media or even make their own forums to answer questions asked by the customers. If the network and wifi speed was slow, not only would the staff that controls the customer service would have trouble connecting, but the customers themselves would find that the customer service would be very unresponsive.

Explain the impact on working efficiency and staff productivity that improved processing power and storage capacity could have.

With the improved processing power of the latest hardware, the working efficiency of the employees have a possibility of improving significantly. The reason for this is due to the ability of the improved processors of running many different software at the same time, giving the employee the ability to multitask.

With the extra storage capacity, the employee is able to have a lot more data than previous hardware. This improves work efficiency due to the fact that 1 single employe can store a lot of information. For example, if the previous hardware had about 100-200 GB storage, and the newer hardware had 1-2 TB storage, 1 single employee would roughly have the workload that would previously be 10-20 people.

Explain how IT developments impact Data Protection and Information.

With the IT industry developing, the data protection and information are much more vulnerable than they were before. The reason for this is due to the IT hardware and software being able to connect to the internet. For example, with cloud storage, you are able to store many things online with the ability to access it with different devices.

Online storage may be a more versatile way of storage, but it is a lot less reliable than local storage. It is possible that local storage can be lost for many reasons, but online storage can be much more unreliable than local storage. For example, if an employee keeps his work only stored online and it gets lost, the only way he could get the work back is if he did a recent backup.

Explain how IT developments impact Computer Misuse and Cybercrime

With much more people using the internet compared to the last decade is massive, but this could also increase the amount of computer misuse and cybercrime over the online world. Online storage would be used as an example to explain how information can be easily hacked or stolen because it is stored online instead of local storage.

This would have a massive impact on the user and his information, especially in a business. The chances of this happening might not be that high for an individual, but for a business it could be more threatening, and the bigger and more well known a business is, the higher the chance of this scenario happening.
