Intended Format and Devices

Intended format

Pre-concept format - .GMX (GameMaker Studio 2)

Before creating the 3D concept of the Untold of Coursant, the game will be created as a simplified version in a 2D engine, to prove whether the storyline has a consistent flow to it and whether it should be implemented or improved into the concept and full release game. Essentially, GameMaker Studio 2 with the GMX (Compressed GameMaker File) format, is going to be used to prove the concept of the story line before the rest of the game concept including visuals, gameplay and a 3D world.

Initial 3D format - .OpenGEX format (Unity 3D)

Initially, for the proof of concept with a 3D world, Untold of Coursant is going to be formatted in the Unity 3D engine (developed by Unity Technologies), as the Open Game Engine Exchange (OpenGEX) format. Unity 3D is only going to be used for internal testing within the company. This is so the theory of the game can be tested, instead of the other essentials such as visuals and gameplay. Hence why the OpenGEX format and Unity 3D engine isn't going to be used for the full retail release of Untold of Coursant.

Full release format - .FBX format (Unreal Engine 4)

Instead, a much more reliable and graphically capable engine, the Unreal engine 4 (created by Unreal) with its FBX (Filmbox) formatting is going to be used for the full completion and retail of the video game. The reason that this format engine would replace the Unity 3D engine and format is due to its much more modern technology and formatting capabilities, which improve vital aspects such as visual graphics, audio quality and gameplay optimisation for user satisfaction.

Intended devices

Untold of Coursant will be designed, developed and sold for certain system platforms which are both popular and have the hardware/software capable of running the game on full release. The intended platform devices that will be supported by the game are:

- PC platform (Multiple manufacturers)
- Playstation (Sony)
- Xbox One (Microsoft)

These devices were chosen due to many reasons, with the main reason being the the hardware and software capabilities. Meaning that video game platforms of this calibre are the most well

suited for the format and engine that the game will be developed for. For instance, if this game was to be developed for another device, it would have very little capabilities in certain aspects such as:

- Visual graphics
- User interface
- Versatile controls
- Fully rendered cutscenes
- Other smaller graphical and characteristic details which gives the game much more flare and genuinity.

Hindering the game's charm and visual aesthetic satisfaction with users, which is becoming a much more apparent selling point in the modern market. These platforms were also chosen due to the fact that they can offer a much wider variety of input and output devices. Intended to be used for a more immersive experience, such as:

- VR headsets
- 7.1 Surround sound capabilities
- Voice recognition through microphone input

There are situations where a user needs specialist tools for specific purposes, whether that be a specific disability or condition, that fortunately is fully compatible with these platforms. These specialist tools can range from:

- Specialised controllers
- Color blind filter options
- Additional components to existing controllers for easier access

Genre and Elements of Gameplay

Game genre

Untold of Coursant is a game that falls under many video game genres, even genres that fall under story writing and certain themes. This is because it is created with the intention of being heavily story based, being inspired by a previously written fictional story and contains a heavy mix of science fiction themes due to the inspiration.

The genres for the type of game that Untold of Coursant would fall under are:

- Single player
- Action

- Third person shooter
- Role-playing
- Stealth

The genres for the story writing aspect are:

- Star Wars fan-fiction
- Cyberpunk
- Urban fiction
- Crime fiction
- Dystopia

Such a specific game genre may seem overly complex, however all these genres are the best possible way to explain the type of environment and story writing that will be featured on the upcoming game.

Gameplay elements

Due to the complex genre classification of Untold of Coursant, the game can feature a plethora of gameplay elements which cross between genres. The gameplay elements of the game will be a standard element to those found in a third person shooter, because it is proven to be simple yet effective. Examples of the basic types of interaction for this type of game include:

- The ability to move around in a 360 degree angle
- Contains a leveling system for the character (for the role-play element)
- Having full view of the character at all times
- The ability to handle and swap different weapons and equipment
- The ability to use said weapons and equipment

The main equipment that the player would tend to use range from:

- healing kits (to restore health)
- lockpick (to enter areas previously locked to the player)
- currency (to purchase items on stores and other markets)

With the unreal engine 4 being used as the final engine for the retailing of the game, it contains the potential of creating a significant amount of gameplay elements, to make the game much more immersive. Some of these elements include:

- Optimised systems for creating characters
- NPC compatibility
- Ability to implement game rules
- Camera perspectives

- Collectible items/weapons
- Vehicles
- Destructible environment/objects

This makes it another main reason that the Unreal Engine 4, with it's FBX format, has the potential to be the full release choice for a specific game such as Untold of Coursant. However, the gameplay elements are only currently a small concept.

Meaning that the basic gameplay elements that will go into Untold of Coursant needs to go through the proof of concept, in order to be tested, before more in depth elements are added. This is so any mistakes could be addressed or re-evaluated as a different or improved gameplay element, which would in turn increase user satisfaction with gameplay.

Market Research

Genre market

Genre wise, Untold of Coursant is equal that to well known open world games. Meaning that it has potential, since multiple games of this genre are succeeding in the market.

With the most successful being Rockstar's Grand Theft Auto franchise, especially their newest release: Grand Theft Auto 5. The reason being that the game follows the pattern of many Rockstar and 2K Games titles. It has open world aspects, contains a story and can fall under the genre of action games and crime story games.

Even though the open world genre of video games has been proven to be successful, it is considered difficult to create to an optimal standard. However, with the introduction of more modern engines (such as the Unreal Engine 4) and hardware capabilities, the open world genre is more likely to be more successful than in the past.

However, at the game's current state the world isn't as versatile or advanced as the world's found on Rockstar's games. Due to the fact the Rockstar company having a much higher budget, but it follows the same gameplay and characterisation style of similar open world games.

Since they all fall under the 3rd person open world action shooter genre and they all focus on the violent and disturbing lives of criminals. Much like Untold of Coursant gameplay wise, however with a complete difference in theme and visual style.

Format market

The demand for newer games on powerful and graphically capable game engines are always at the highest when dealing with the video game market, especially for console and PC users. This is due to the constant evolution of hardware and software capabilities.

The first engine to be used for the game is a 2D GameMaker Studio 2 engine in the GMX format, with the only intention for the use of this engine is going to be used is for the pre-concept of the game. Meaning that the game itself isn't going to be marketed in the pre-concept configuration.

Instead, the engine that has been chosen is the Unreal Engine 4 as the full release, instead of the Unity 3D engine. Due to the fact it is used as a proof of concept, since the Unity 3D engine is easier to develop a game using 3D graphics, because of the simple format and compatibility of the engine compared to other engines.

However, the engine is very unstable to run a large game and it is becoming outdated. Therefore the game wouldn't stand out as much in the modern market and would received mixed reviews at best due to the instability of game performance and lack of visual style.

Hence why the Unreal Engine 4 is going to be used at full release, instead of the less superior Unity 3D engine. Since Unreal Engine 4 is a very advanced and modern engine, with some of the newest games being developed on the engine, due to it's amazing capabilities as a 3D engine.

However there are downsides for having such a modern engine. The most significant downside is that it is very difficult to create and optimise a game for both PC and consoles, especially with the engine format being too much for the majority hardware to handle properly. This does not mean that it will be impossible however, only very difficult to perfect.

Device market

The latest console and gaming computers are very large and successful on the modern day market. This is due to the hardware being powerful enough to run almost picture perfect graphics at an affordable rate, proving that the visual style of a game is as important as gameplay. The most popular consoles and other gaming devices in the market (excluding smartphones) currently are:

- Playstation 4 (with the new Playstation 4 Pro with improved hardware capabilities)
- Xbox One (with the new Xbox One X also with improved hardware capabilities)
- Personal Gaming Computers (with the latest hardware being significantly better than consoles)

Since these platforms are the highest grossing in the modern market for video games (excluding smartphones) and contains well performing hardware capabilities by modern standards, it

seems like a logical approach to develop a game, with a widely appreciated genre and theme, associated with the listed platforms.

Additional research

Star wars is a very popular franchise and has a very large fanbase since the release of the first Star Wars movie by LucasFilm. With this colossal fanbase, it comes without surprise that there have been a great quantity of games released with the beloved Star Wars theme. The most successful Star Wars games being:

- Star Wars: The old republic (Role-playing)
- Star Wars: Battlefront 2 (2005) (Third/First person shooter)
- Star Wars: Battlefront (2004) (Third/First person shooter)
- Star Wars: The Force Unleashed (Hack and slash)
- Star Wars Knights of the Old Republic II: The Sith Lords (Role-playing)

These Star Wars games are considered one of the best by the populus. However, they are becoming very outdated with the most recent release being 2011 (Star Wars Knights of the Old Republic II: The Sith Lords). Meaning that there hasn't been many recent releases that have been successful, which increases the demand from the fanbase.

Examples of the most successful Star wars games that are also the most recent are:

- Star Wars: Battlefront (2015) (Third/First person shooter)
- Star Wars: Battlefront 2 (2017) (Third/First person shooter)

Even at the most successful, the most recent Star Wars games still suffered controversial reviews from the public due to the publisher (Electronic Arts) for charging a lot of money for the game and additional content.

The developers for the game didn't focus on gameplay as much as the audience wanted, instead focusing on the visuals of the game, so the game lost the fanbase rapidly. Proving that even with fantastic graphics capabilities, gameplay is still a vital component to video games.

Overall, with the lack success from recent Star Wars games being released and the popularity increasing, due to new movies being released for the Star Wars franchise by the Walt Disney corporation, the Star Wars gaming market is desperate to receive a new Star Wars game that can both deliver fantastic visual graphics and gameplay.

With the research carried out, the final conclusion is that the market seems to be interested in newer Star Wars games, especially ones that have never been done in an open world genre.

Meaning that Untold of Coursant (if done successfully) could be a successful concept in the modern market.

Demographic

Target audience

Intended audience - Players over the age of 18

This game concept isn't necessarily targeted at a specific group of people, gender or race. Instead, it is mostly targeted at adults who enjoy:

- Story based games
- Open world games
- Action games
- 3rd person shooters
- A dark story

However there are some scenes planned for the game considered to be extremely graphic and promotes the dark/gritty theme of the game, meaning that the video game would most likely be rated for 18 year olds and over by video game content descriptors.

However that doesn't hinder the purchase rate of the game a significant amount. As statistics show, some of the most popular games sold on the market are rated at mature audiences, meaning they are rated at the age of 18 and over.

The combat element, stealth system and overall action is something that will [theoretically] attract males to the game. However, with a female protagonist and a heavy storyline, it could be more likely that it would bring a more variety of genders and players to the game.

Untold of Coruscant potentially has a specific taste for the users with its cinematic storyline. However since the target audience for the Star Wars and open world genres are very popular within the gaming industry, the game has the capability to [potentially] get everyone to enjoy the game.

Essentially, the game will fit a majority of the target audience. Only that's if it falls within their personal taste and for those who don't mind seeing extreme violence, explicit language, use of drugs and mild sexual content. Which would seem to be very likely to be successful due to the market research done on games that fall under this category.

Languages

For the initial release, the languages for the game will only be in

- English (UK)
- English (US)

Furthermore, if the popularity of the game surges in sales, it is more likely that additional languages will be implemented into the game, for wider distribution. Which is going to be done by prioritising languages by popularity in the gaming community, then adding additional languages if sales are good in other territories.

Theoretically, if the game were to be successful, the additional languages that would be added are:

- Russian
- Korean
- German
- Spanish
- French
- Japanese
- Portuguese (Brazilian)

These languages would be the first priority since they are the most spoken languages in the gaming community (excluding English). Furthermore, additional languages will be added depending of the success of the video game throughout all of its initial regions.

Distribution territories

The initial release of Untold of Coursant will be in both UK and US English. Meaning that the distribution territories will include some of the nations found within the British Commonwealth of Nations, such as:

- Canada
- United Kingdom
- Australia
- India
- Ireland
- New Zealand

The game is also to be distributed to all 50 states across the United States of America on full release, including Alaska and Hawaii.

If the game where to succeed in sales and be distributed to a wider plethora of languages, the distribution of the video game would expand to those countries which also fall under the languages considered highest priority, which are:

- Russia
- South Korea
- Germany
- Spain
- France
- Japan
- Brazil

If the game sees success in regions which have previously not been mentioned in the list, it is possible that a wider expansion of territories sold would increase.

However, the reason that the amount of territories are very little is because the concept of a game like this is very unique. Especially with the widely known Star Wars theme, so it is very difficult to determine the success of the game outside of countries which have a large following to the Star Wars franchise.

Overall Content

Untold of Coruscant concept overview

PC / Xbox One / Playstation 4 (CD retail / Download)
Target age: 18+
Rating: PEGI 18

Game overview

Untold of Coursant is a game idea that has been inspired by the Star Wars universe. It will be a Single player, 3rd person, open three dimensional world with a heavy story implementation.

With the game having a heavy focus around the dark and gritty life of a young woman within the slums of the underworld in the city planet of Coruscant, infested by poverty and crime. Where the player will take part in certain crimes and immoral actions throughout gameplay in order to survive.

Objectives

In the current concept for the game there will be a main objective for the user, which will be the main story. The goal of the main story is to survive through the violent setting of the game (the underworld of Coursant), where the player will do a collection of missions which vary from each other, to prevent repetition. These objectives can range from:

- Theft (weapons, vehicles, narcotics, etc.),
- Bounty hunting/Assassination
- Smuggling
- Illegal trading/retailing

There will be more objectives added for the player as the game concept evolves, these objectives will be side missions in case the user finishes the game, wants more content or if they are worn out by the main story of the game. These objectives are mostly less extreme than the story missions, but could still be entertaining. The additional objectives range from:

- Competitive/Non-competitive sports
- Gambling
- Racing
- Contract work
- Espionage
- Additional trading/retailing

Theme

The theme to the game is heavily based off the Star Wars universe, with additional science fiction themes, such as the well known “Cyberpunk” theme. The reason for this being that, Star Wars mixed with such alternative science fiction themes, could bring more personality to the gameplay for the user. Potentially giving a different feeling to the game, while still keeping that Star Wars theme that is widely appreciated.

Structure

The structure of the game is going to a linear storyline with an open world environment for the user to explore on. Essentially, if the user is carrying out a story mission or and objective they progress through the game world, unlocking more areas in the game world to explore afterwards.

Giving the user a sense of completion which can be deemed satisfying for a majority of players. Which can persuade the player to play the linear storyline not only for the story, but for the unlock ability.

Having an open world environment can let the player explore without the restrictions of a completely linear game, which may be frustrating or boring for certain players. So, not only is this so there is a larger capacity to introduce more side objectives in addition to the main story, it also gives the user much more freedom in gameplay outside the main story.

Original features

An original feature that will be found with Untold of Coursant is that it will contain it's very own economic system, which is going to have its own user interface for the user to access. This economic system tracks the illegal and legal trades throughout the economy, whether it is the player's or the market in general.

However, the player doesn't have access to the market at the start of the game. The player has to build up connections and gather information about certain connections within the market, whether it be illegal or legal.

User interaction with characters/NPCs

The user will only have control of a single character, that being the main protagonist to the main story of the game. However, the user can also interact with other NPCs throughout gameplay in order to access the content within the game.

For instance, the player could approach an NPC with an indicated objective (a hovering star above the NPC and labeled on the mini map) and interact with the NPC with the key instructed on the user interface. Which would then start the NPC and player dialogue to commence the objective.

Another form of interaction would be accessing the market. Whether it is through a store or an NPC posing as an illegal retailer. For immersion, interaction with most NPC would just trigger a dialogue without accessing any specialised content within the game, to make the world feel more genuine and interactive to the player.

Game Mechanics

User interface

The UI (user interface) of Untold of Coursant will display simple but vital information to the user, such as objectives, an ammo count bar, a police notoriety bar, a minimap box and pop-up instructions. Also, there will be other forms of indication which technically aren't part of the user interface, such as health and stamina.

Objectives Bar - The objectives bar will be found on the top left of the user interface while in gameplay. The bar will contain the currently selected objective, with the type of the mission being colour coded. The type of colours varying from:

- Golden (Main story mission)
- Red (Objective involves a high risk of the character's death)
- Amber (Possible risk of the character's death)
- Blue (Low to no risk of the character's death)

Ammo Count Bar - The ammo count bar is a simple counter in the top right of the user interface which consist of two numbers: The amount of ammunition available for the current weapons and the amount of ammunition in reserve for the weapon.

Police Notoriety Bar - The police notoriety bar is a long, thin bar located above the minimap on the bottom left of the user interface. The police notoriety bar will increase with a blue filling from left to right depending on the likelihood that the police will pursue the player. If the bar is full, it will go from a flat blue to a flashing red and blue, indicating that the police are on high alert while pursuing the player.

Minimap Box - The minimap box will be located at the bottom left of the screen of the user interface. The minimap will be a small indication of the player's current location, with a white circle as an indication and a field of view indication, to show the player the general direction the character is facing.

The minimap box will also contain other NPCs in the area, whether they are friendly or hostile. Indicated with a blue circle (friendly) or a red circle (hostile). There will also be specialised indications on the minimap. For instance the police force, which they will be a purple circle when neutral to the player and flashing red and blue when hostile to the player.

The minimap will also indicate if the NPCs around the player's proximity are above or below ground, by having an arrow pointing up or down inside the hollow circle indicator. It also features indicators for objectives, which is a colour coded star on the minimap. Just like the objectives bar, the mission will be colour coded depending on what type of mission it is, which includes:

- Golden (Main story mission)
- Red (Objective involves a high risk of the character's death)
- Amber (Possible risk of the character's death)
- Blue (Low to no risk of the character's death)

Pop-up Instructions - The pop-up instructions are a line of text that appears on the user interface indicating when a user has to interact with the game. For example:

- Press "square"/"R" to reload the weapon
- Press "triangle"/"E" to enter the vehicle
- Press "right on the D pad"/"Q" to heal

Health (Indicator) - The health indicator is a red border of the user interface that increases the more damage the player is taking. When the player is at critical health the screen will go into grayscale, instantly indicating the user that the player is critically damaged.

Stamina (Indicator) - The stamina indicator is an audio indicator in which the character would start the breathe more heavily the more the stamina depletes. When the user can hear the breathing getting heavier over time, they will realise that the stamina is depleting with the character, meaning that the character might slow down or come to a complete stop.

Character control

During gameplay, the only character the user will be controlling is the main protagonist to the story named Alisia. Depending of the platform the user is playing the game on, the character can be controlled. At the current stage of the concept, the character only has basic controls found with most third-person shooter games.

For the Playstation 4 platform, the current controls featured are:

- Triangle to interact with objects
- X to run
- Square to reload a weapon
- Left analog stick to move in a 360 degree angle
- Right analog stick to look around in a 360 degree angle
- R2 to fire the weapon
- L2 to aim the weapon
- Right on the D pad to heal
- Options to open the pause menu
- Dpad up to access the map

For the Xbox One platform, the current controls featured are:

- Y to interact with objects
- A to run
- X to reload a weapon
- Left analog stick to move in a 360 degree angle
- Right analog stick to look around in a 360 degree angle
- R Trigger to fire the weapon
- L Trigger to aim the weapon
- Right on the D pad to heal
- Start Button to open the pause menu
- Dpad up to access the map

For the PC platform, the controls are much more customisable to the player when compared to the console platforms. However, the current default controls featured are:

- E to interact with objects
- Shift to run
- R to reload a weapon
- W to move forwards
- A to move to the left hand side
- D to move to the right hand side

- S to move backwards
- Mouse look around in a 360 degree angle
- Left mouse button to fire the weapon
- Right mouse button to aim the weapon
- Q to heal
- Esc to open the pause menu
- M to access the map

Game environment interaction

During gameplay, the user will be able to interact with certain aspects of the environment that can aid the user with exploration a better understanding of the story of the game world. This can be done through:

- Interaction with Non-player Characters (which trigger certain dialogues),
- More methods of transportation (accessing a vehicle or other forms of transportation)
- Details which add to immersion (destructive environments and objects).

The game world will feature objects that can be intractable by the user. Examples of such objects include:

- weapons (can be picked up and used for combat),
- vehicles (can be embarked and commandeered),
- Equipment (can be picked up and used for its purpose),
- Stores (can be entered and items can be purchased depending on the type of store)
- Destructible objects (wooden crates, doors, streetlights, etc.).

Backstory

Story (Playable character)

Alisia - Planned for the initial story, the main character (named Alisia) has an extremely vague personality wise due to her lack of communication, mysterious background and the constantly-changing conditions of the environment the character lives on.

The main protagonist’s exact age will be unknown to the player due to the fact it won’t be mentioned, it will noticeable that she might be in her late 20s or early 30s from the structure of the character model.

Although throughout the story she is heavily impacted by significant events with her relatives and other individuals that that character has had close relations with. That would get the character to start developing feelings of sympathy, regret and grief as the story progresses.

Along with the development of such emotions, it will be evident that he main character will show symptoms of an existential crisis, with the character openly questioning why such brutal and inhumane crimes are carried out.

However the storyline of "A female protagonist taking the role of a cold blooded criminal" is something that could cause some controversy for the target audience, especially with some of the male players to the game. Due to some possibility of misunderstanding and imagining it as some sort of subliminal message, which has been apparent with recent video games and movies.

The game features a female protagonist for a game like this is because there isn't a lot of female protagonists found in video games in the current market, especially ones with this type of genre. So, by adding a female as a playable character, it would be a breath of fresh air for the players and would bring an interesting perspective for the player, which would hopefully get the game more attention.

Story (NPCs)

Bodhi - Bodhi is the second main character to the Untold of Coursant storyline. Bodhi is a much more mysterious character than Alisia in Untold of Coursant. At the beginning of the game, the player will notice that Bodhi will always be around Alisia as a sort of acquaintance, which is the relationship the two have.

Bodhi's background isn't going to be said at throughout the game, until the final parts of the game where it finally reveals his true character to both Alisia and the users playing the game. All that will be known of Bodhi throughout the story is that he is a smuggler which has been orphaned from a young age, so he is almost completely self taught.

This will make the player feel that Bodhi is the closest person to Alisie, but he is still untrustworthy due to the amount of mystery and kept secrets until the final reveal at the end of the game.

This type of character will build up fear and assumptions by the player throughout the game, because of the lack of dialogue from the character but the constant appearance. Which would make some think that the character is mute.

This character would be a suspension technique for the audience due to the amount of unanswered questions that the character brings, but it would be for certain that something would happen to Bodhi due to his constant appearance next to Alisia.

Hostile criminals - These are the standard hostiles that will be met anywhere throughout the game. They are a very common hostile which can be found in a lot of areas around the map while the user is roaming the open world side of the game.

They have a very low combat experience, meaning that they will often miss their shots when in a combat situation. These hostiles feature very low hit points and very low to moderate damage output, making them the least threatening hostile but still has the ability to kill the player.

Hostile gang members - Gang members are a much more upgraded and hardened version of standard criminals. This is due to the fact that they have much more expensive hardware, weapons and equipment, making them much more of a challenge to face.

However, they are still very untrained meaning they don't have much competence, but noticeably more than the standard criminal. These hostiles feature moderate hitpoints and a moderate to high damage output, making them much more difficult to face against when alone but still possible to combat against when the player has a couple of friendly NPCs.

Allied gang members - Allied gang members are exactly the same as hostile gang members in statistics, however they do not target the player as a hostile. Instead, these NPCs are characters that the player will encounter during story missions or through exploring the open world, with the ability of hiring the members. Essentially, friendly gang members are used to help the player in combat situations in a mission or in the open world, especially if the hostiles are overwhelming.

These NPCs always try and stay close enough to the player so they can help with combat situations. They even have the ability to revive the player if the character is shot, but it's only a one time limited use.

The police force - The police force is a sophisticated organization of elite personnel, a significant difficulty jump from criminals and gang members. This is due to their ex-military background and specialised training to deal with the harsh underworld of coursant, making them extremely challenging to face.

Since the police force is a highly trained, elite, ex-military force means that they have extremely high expertise in combat and have high tech hardware, weapons and equipment to deal with criminals and gang members.

These hostiles feature very high hitpoints and very high damage output, making them impossible to face alone and extremely difficult with a group of friendly gang. This means that

the player would try and avoid police contact at all costs, even utilising the stealth mechanic within the game.

Pedestrians - Pedestrians are passive NPCs that exist throughout the world of the game, making it feel more alive and immersive for the player. They don't serve much of a purpose appart from immersion. However, they can be interacted with, triggering dialogue to the player.

Shopkeepers/Retailers/Dealers - These NPCs are stationary or passive characters which can only be interacted with to purchase certain items, depending on what type of NPC it is.

For instance, a shopkeeper would sell items such as food or health packs for consumption. This NPC is the standard tradesman of the game and will be readily available to the player once the prologue is completed.

Retailers are upgraded versions of shopkeepers, with much more items to purchase for consumption such as legal weapons, large health packs, vehicles or legal narcotics. This will become available for the player as they play the game, unlocking certain territories.

Dealers are the illegal tradesmen of the economy within the game. They can sell anything that is available from the black market for a limited time each such as illegal weapons, equipment, vehicles, narcotics and explosives. This will also become available for the player as they play the game and complete certain objectives.

Story (Game world)

Game setting - Coursant (Fictional Star Wars planet)

The story of the game world will be based off the fictional planet Coruscant, found in the Star Wars franchise as a virtually legitimate planet in its universe. This planet will be is only current setting to the video game. However, there are further aras for the game that there will be other locations on the planet as the user progressed throughout the game.

Where it will take place initially is in the underworld of the planet. Which is the surface of the city planet's towering skyscrapers found in a few of the Star Wars movies. This underworld is filled with crime, poverty and heavy enforced by an elite police force.

In this game world, the player will explore certain territories as they play throughout the game. Unlocking territories owned by different gangs in the underworld. If the player unlocks enough of the world, they will be able to travel to the even more dangerous underground, where they may find much more hostile NPCs to encounter.

Overall, the game world is still at early concept meaning that it is still a very simple setting. However, with the possibility of expanding the game world, it may be possible for the player to travel to the richer parts of the planets such as the high rise skyscrapers.

Game Environment

Gameplay visuals

Due to the theme of the game, the environment has a gritty and cyberpunk feel to it, due to the high tech but low living standards that are found with the underworld. Which makes it a fitting place for crime, violence and an overall immoral lifestyle found in many of the characters for the game.

The game world has been designed so, with first impressions, the player can comprehensively tell that the world that the main character thrives in is a crime filled metropolis which was completely plagued poverty, also that the underworld has a dark and stingy environment due to the nature of crime and poverty making it poor for the government and police to maintain.

The visuals will also add to the story by creating an environment that looks torn and poorly kept together, giving a feeling of suffering and desperation to the populous affected by the corruption of the underworld. Giving the user an illusion of what can be obtained wouldn't really be considered the best but it is a lot better than nothing and extremely essential to have.

A weather and somewhat of a day/night cycle system will also be implemented into the video game to add immersion for the user of a living, breathing world. The weather system will consist of rain, heavy rain and snow. This may seem very simple, however the setting of the game is on the underworld of an earth-like planet which is completely blocked off by the high rise building covering the entire planet.

With the high rise buildings in mind, the day and night cycle system is going to be different to other games with the system implemented. For instance, instead of having a full day time and full night time, the game will feature a slight lighting from the sun (mostly blocked by the high rise buildings) or Complete darkness (due to the night cycle).

Gameplay Audio

Audio for a video game is extremely vital, because it can be used to give a genuine feeling and emotional impact on the user. With that in mind, the audio found in the video game will be inspired by the sound effects and music found within the Star Wars movies, to give the player the immersion that they are experiencing a genuine Star Wars setting. Essentially, the audio of

the game will be used for both immersion into the Star Wars universe and for dramatic even on certain events within the game.

For the immersion aspect of the audio the game will feature sounds such as ambient music, background noise, vehicle sounds, weapon sounds and other sound effects found with other Star Wars games and movies to give the player the familiar feeling of the Star Wars setting.

For the dramatic effect, the audio used will be purely for tension or a buildup for a certain event within the game. This is to stimulate the user's emotions while experiencing a tense moment within the game. For instance, if the user is being chased by the police force, a very intense soundtrack would play to make the user more alert and intense.

Emotional setting

The emotional setting of the game would be a very dark and deep setting for the user, due to the age rating and story of the game. So, the emotions that the user will be experiencing will be very gloomy throughout the story.

Throughout the gameplaye, the emotions that the user will be experiencing would range from intense to alert. An example for this point is the fights that are likely to take place during gameplay, with all the different high tech weapons available. With the addition of the audio, it gives it a much more intense feeling, hence ties into this category.

The gameplay can also be very disturbing for the player, depending on how sensitive they are to the brutal combat style of criminals and gang members found through the game. Which may be a turning point for certain users playing the game. Therefore, an option to reduce gore has been fitted to either reduce or increase the amount of gory violence to the user's content.
