

The sequence diagram for Portfolio 1 (Use Case Diagram) is the sequential flow of the requirements needed to carry out a scenario (i.e. cancellation of a booking). These requirements are how users interact with a software environment. Thus, the actors in the use case diagrams are represented as participants. Implying a relationship of users interacting with the flow of events in a software environment. Consequently, this shows an environment structure which is carried out linearly, as it would in reality.

The sequence diagram for Portfolio 2 (Class Diagram) is a sequential flow of the design of the application during a scenario. The environment in which the operations are carried out is iterative, due to the fact that it is a representation of a machine capable of carrying out multiple operations simultaneously. Therefore, the sequence diagram has overlapping activities, classes are participants and no users are shown.

In conclusion: While they technically are in conformity with each other in terms of carrying out a task, they are not in conformity in terms of showing the environment in which it's carried out. Due to both sequence diagrams carrying out the same scenario on one application, but from a completely different perspective.
